Nucleic acid molecule encoding mammalian phospholipid transfer protein, and its fragments, useful for diagnosis, evaluation, and treatment of diseases associated with the gene expression and for producing model systems.

Claim 49; Fig 24; 159pp; English.

This sequence represents a fusion protein of the invention between the Fl1 receptor and the Fc region of 1gG. The specification relates to modified chimeric polypeptides with improved pharmacokinetics. The modified chimeric polypeptides are preferably Fl11 receptor polypeptides that have been modified to improve their pharmacokinetic profile. The polypeptides can be used to decrease or inhibit plasma leakage and/or vascular permeability in a mammal

The piresult invention and amount or a human. The method comprises administering a vascular endothelial cell growth factor (VEGF) antagonist control and amamal or human. A VEGF antagonist has antipostriatic, antianthrial cantinflammatory, vulnerary, antiathmatic, antirheumatic, antianthrial cantinflammatory, vulnerary, antiathmatic, antirheumatic, antianthrial conspiration in promises and enhancing wound healing in humans by administering to VEGF antagonist. The method is also useful in treating clinical conditions characterised by vascular permeability, oedema or conditions characterised by vascular permeability, oedema or conditions that inflammation, such as brain oedema associated with inflammatory disorders (e.g. rheumator) associated with inflammatory disorders (e.g. rheumator) as age-related castuma, burns, kidney diseases, or eye disorders such as age-related consecutation and diabetic retinopathy. The method may also be used in making the polypeptide to decrease or inhibit plasma leakage and or vascular permeability. The present sequence represents invention
